

Data Warehouse Lab 7

Task 1

Control Flow executing tasks which use queries from previous assignment.

Task 2

1. Consider a different approach, where data in the resultant storage is not fully refreshed.

a. In such a case we need to wait until data in both ProductDIM and TimeDim tables will be refreshed and after that update values of OrderFact table;

b. After refresh of OrderFact table we need to extract new data from rows and update ProductDim and TimeDim tables based on the new values of OrderFact rows;

c. As data addition is not coupled between tables, in this case we might add a check to validate if new data is present in all tables and that tables are synchronized.
